

Note: The USB downloader only supports computers with WIN8.1/8/7/XP 32-bit/64-bit systems, and does not support Win10.

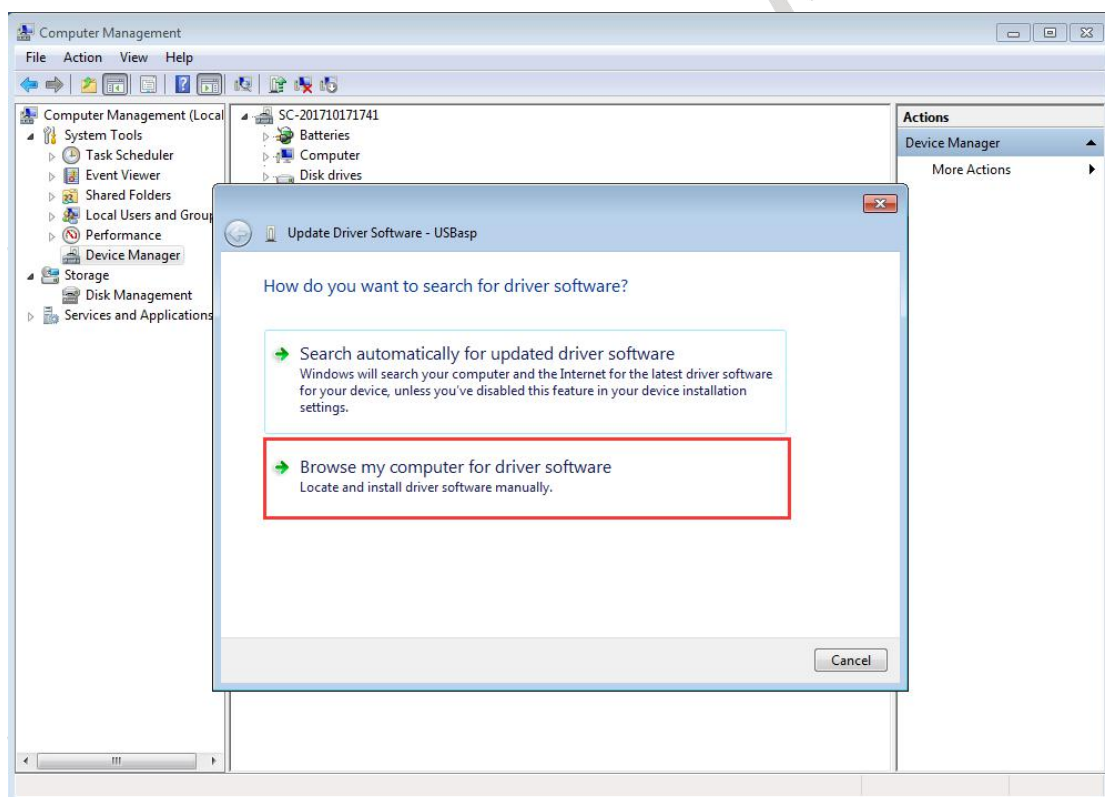

1. Insert the USB downloader into the computer and open the device manager of the computer. In the device manager, if the port of the module can be displayed and there is a warning symbol (as shown in the figure below), then the driver of the module has not been installed successfully. You can install it according to the following steps. If nothing is displayed in the device manager, then the computer cannot recognize the USB module, and you need to change the computer or operating system.

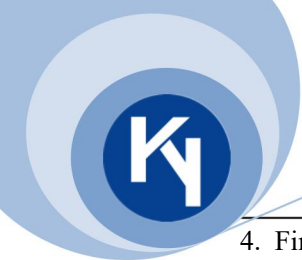

2. Right-click on USBasp and select the first item to update the driver.

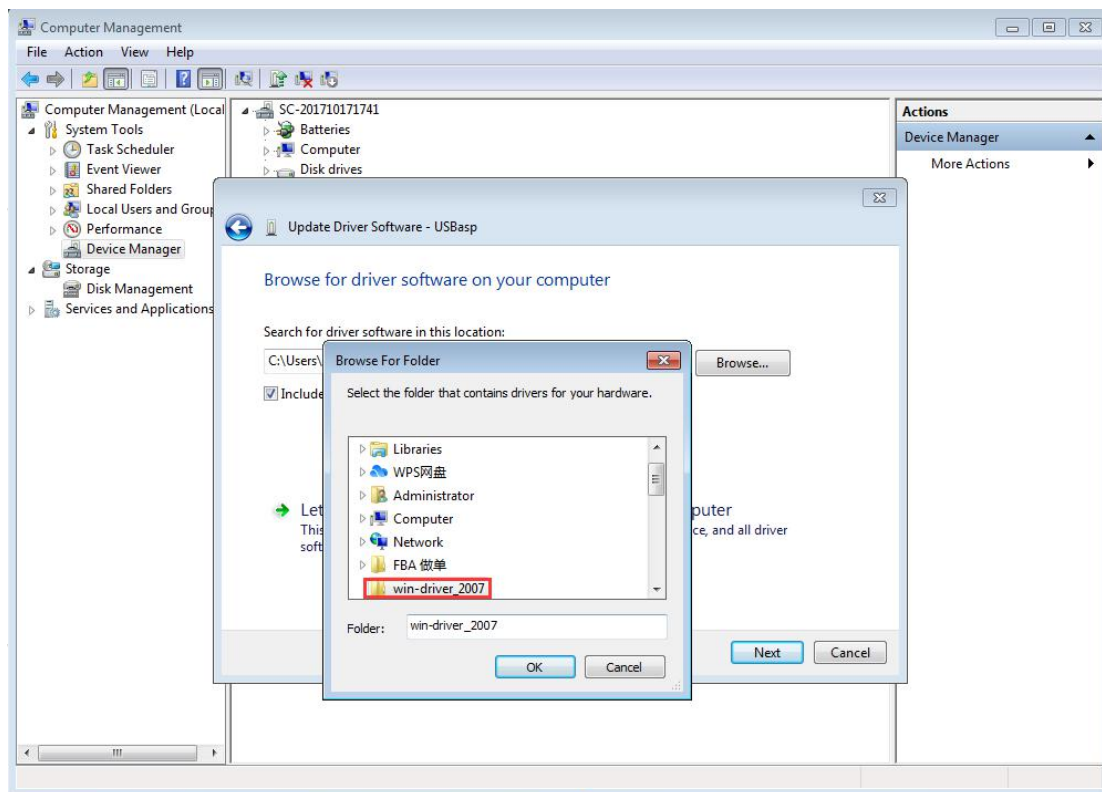

3. Select the second item in the pop-up window to browse the driver in my computer.

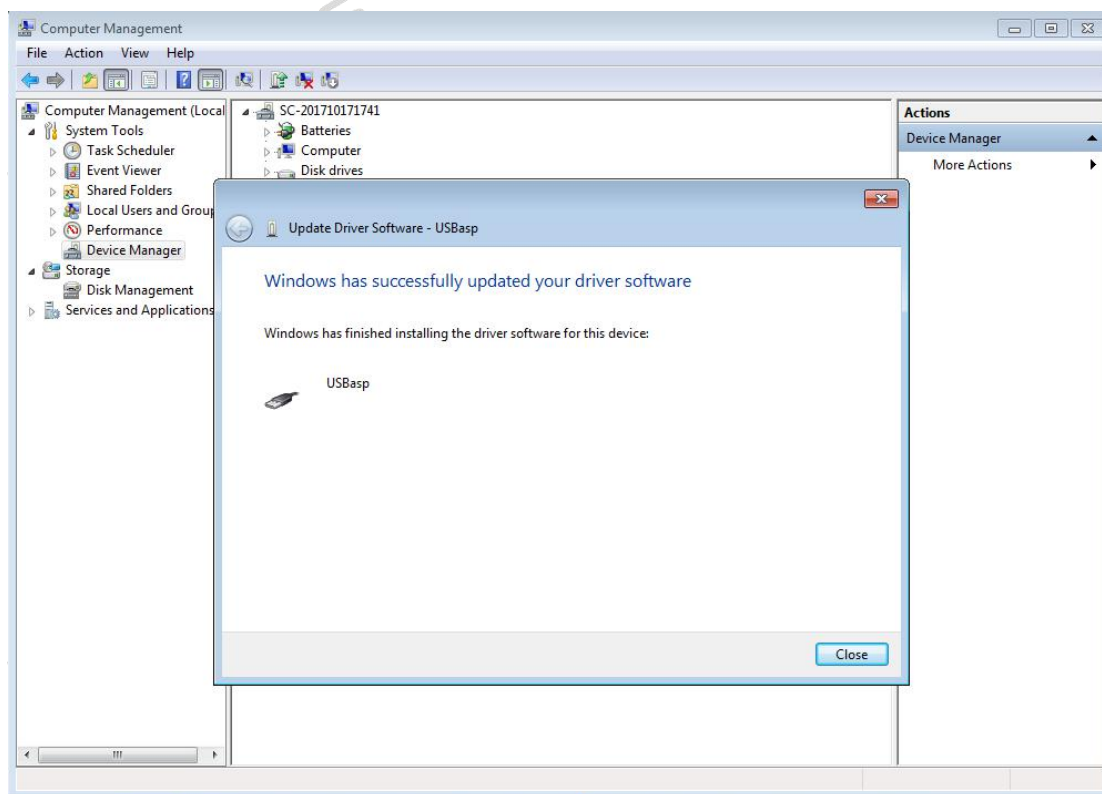

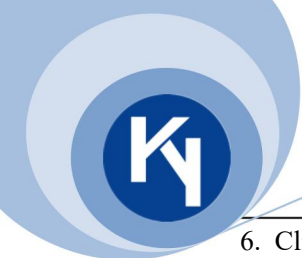

4. Find the driver file we provide in the folder (if it is a compressed package, you need to unzip it), and then click OK.

5. After the installation is complete, the following information will be prompted.

6. Click Close and then open the device manager of the computer. The USB module in the device manager is displayed as shown below.
